idsideAI v7 — Board Summary

This document provides a high-level overview of idsideAI v7 as delivered. It highlights what has been achieved, what remains stubbed, and why this release is category-defining.

Key Achievements:

- Full multi-user + org model with RBAC

- Decision Models: creation, versioning, export (JSON/CSV/PDF)

- Turbo optimisation integrated with plan gating

- Telemetry: latency, cost, provider rollups

- Compliance: org-wide exports via Celery to S3, presigned URLs

- Security: Vault with AES + AWS KMS encryption

- Scaling: Celery + Redis workers, Docker/K8s manifests

- Storage: real S3 integration with presigned URLs

- Identity: OIDC live + SCIM provisioning

- Internationalisation: 8 languages supported

Remaining Stub:

• Billing/Payments: Stripe integration not yet wired (entitlements and quotas are real).

idsideAI v7 is a production-ready, PyCharm-frictionless package that delivers against the business plan. It demonstrates a credible, category-defining AI orchestration layer. Only billing integration remains deferred, by design, for simplicity at this stage.
